

### **Last Time Buy**

These parts are in production but have been determined to be LAST TIME BUY. This classification indicates that the product is obsolete and notice has been given. Sale of this device is currently restricted to existing customer applications. The device should not be purchased for new design applications because of obsolescence in the near future. Samples are no longer available.

Date of status change: April 1, 2024

Deadline for receipt of LAST TIME BUY orders: July 31, 2024

#### **Recommended Substitutions:**

For existing customer transition, and for new customers or new applications, refer to the ACS725LLCTR-40AB-T.

NOTE: For detailed information on purchasing options, contact your local Allegro field applications engineer or sales representative.

Allegro MicroSystems reserves the right to make, from time to time, revisions to the anticipated product life cycle plan for a product to accommodate changes in production capabilities, alternative product availabilities, or market demand. The information included herein is believed to be accurate and reliable. However, Allegro MicroSystems assumes no responsibility for its use; nor for any infringements of patents or other rights of third parties which may result from its use.

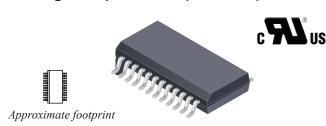

#### **FEATURES AND BENEFITS**

- Fully differential architecture for improved immunity to offset drift and common mode noise
- Spare differential back end amplifier for externally adjustable gain and bandwidth using simple RC networks
- Greatly improved bandwidth through proprietary amplifier and filter design techniques
- High bandwidth 120 kHz analog output
- Patented integrated digital temperature compensation circuitry allows nearly closed-loop accuracy, through entire temperature range, in an open loop sensor
- 1.1 m $\Omega$  primary conductor resistance for low power loss and high inrush current withstanding capability
- Small footprint, low-profile QSOP24 package suitable for space-constrained applications
- Integrated shield virtually eliminates capacitive coupling from current conductor to die due to high dV/dt voltage transients

Continued on the next page...

#### Package: 24-pin QSOP (suffix LF)

#### **DESCRIPTION**

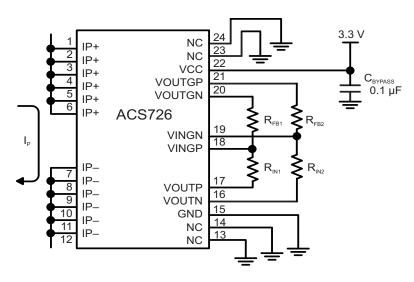

The Allegro™ ACS726 current sensor IC family provides economical and precise solutions for AC current sensing in industrial, commercial, and communications systems. The device package allows for easy implementation by the customer. Typical applications include motor control, load detection and management, switched-mode power supplies, and overcurrent fault protection.

The fully differential output gives superior immunity to output offset drift as well common mode noise.

ACS726 is the first current sensor IC to include a fully differential back-end amplifier (BEA) that can be used to adjust gain and bandwidth via external RC networks. The BEA is fully independent and when unused, it can be powered down to reduce power consumption.

The device consists of a precise, low-offset, linear Hall sensor circuit with a copper conduction path located near the surface of the die. Applied current flowing through this copper conduction path generates a magnetic field which is sensed by the integrated Hall IC and converted into a proportional voltage. Device accuracy is optimized through proximity of the magnetic field to the Hall transducer. A precise, proportional

Continued on the next page...

**Typical Application** 

Current sensor IC gain can be set using RFB and RIN

## Galvanically Isolated Current Sensor IC with Differential Output and Externally Adjustable Gain

#### **FEATURES AND BENEFITS (continued)**

- 3 to 3.6 V, single supply operation
- Factory-trimmed sensitivity and quiescent output voltage for improved accuracy
- Chopper stabilization results in extremely stable quiescent output voltage
- · Ratiometric output from supply voltage

#### **DESCRIPTION** (continued)

voltage is provided by the low-offset, chopper-stabilized BiCMOS Hall IC, which is programmed for accuracy after packaging. The output of the device has a positive differential voltage ( $V_{OUTP} - V_{OUTN}$ ) when an increasing current flows through the primary copper conduction path (from pins 1 through 6, to pins 7 through 12), which is the path used for current sensing. The internal resistance of this conductive path is 1.1 m $\Omega$  typical, providing low power loss.

The terminals of the conductive path are electrically isolated from the sensor IC signal leads (pins 13 through 24). This allows the ACS726 current sensor IC to be used in high-side current sense applications without the use of high-side differential amplifiers or other costly isolation techniques.

The ACS726 is provided in a small, low-profile surface mount QSOP24 package (suffix LF). The leadframe is plated with 100% matte tin, which is compatible with standard lead (Pb) free printed circuit board assembly processes. Internally, the device is Pb-free, except for flip-chip high-temperature Pb-based solder balls, currently exempt from RoHS. The device, excluding the BAE, is fully calibrated prior to shipment from the factory.

Common Mode Offset Voltage	V <sub>CMOE(BEA)</sub>	V <sub>CC</sub> = 3.3 V, G <sub>CL</sub> = 2, T <sub>A</sub> = 25°C to 150°C	-250	±20	250	mV
DC Output Resistance	R <sub>OUT(BEA)</sub>		-	<1	-	Ω
Linearity	Err <sub>Lin(BEA)</sub>	G <sub>CL(BEA)</sub> = 2, Over 2 V differential dynamic range	-	<±0.1	_	%

<sup>[1]</sup> If larger resistor values are used, settling time deteriorates. Adding a capacitor in parallel with the feedback resistor improves settling time.

<sup>[2]</sup> Allegro does not guarantee BAE performance and stability for Closed Loop Gain outside the recommended range.
[3] The Back End Amplifier can be powered-down by connecting VINGP and VINGN to GND, causing VOUTGP and VOUTGN to be = V<sub>CC</sub>/2.

#### CHARACTERISTICS DEFINITIONS

#### **Accuracy Characteristics**

**Differential Sensitivity (Sens**<sub>diff</sub>). The change in the differential sensor IC output  $(V_{OUTP} - V_{OUTN})$  in response to a 1A change through the primary conductor. The sensitivity is the product of the magnetic circuit sensitivity (G/A) (1~G=0.1~mT) and the linear IC amplifier gain (mV/G). The linear IC amplifier gain is programmed at the factory to optimize the sensitivity (mV/A) for the full-scale current of the device.

**Noise** (V<sub>NOISE(RMS)</sub>). The unfiltered output noise of the current sensor IC. Dividing the noise (mV) by the sensitivity (mV/A) provides the smallest current that the device is able to resolve.

Linearity Error (Err<sub>LIN</sub>)\*. The ACS726 is designed to provide a linear output in response to a ramping current. Consider two current levels, I1 and I2. Ideally, the sensitivity of a device is the same for both currents, for a given supply voltage and temperature. Nonlinearity is present when there is a difference between the sensitivities measured at I1 and I2. Nonlinearity is calculated separately for the positive (Err<sub>LIN pos</sub>) and negative (Err<sub>LINneg</sub>) applied currents as follows:

$$Err_{LINpos} = 100(\%) X \left\{ 1 - \left( \frac{Sens_{IPOS2}}{Sens_{IPOS1}} \right) \right\}$$

$$Err_{LINneg} = 100(\%) X \left\{ 1 - \left( \frac{Sens_{INEG2}}{Sens_{INEG}} \right) \right\}$$

where

 $Sens_{Ix}$  = (V\_{IOUTdiff(Ix)} - V\_{IOUTdiff(Q)})/ Ix and IPOSx and INEGx are positive and negative currents. Then:

$$Err_{LIN} = max(Err_{LINpos}, Err_{LINneg})$$

**Differential Quiescent Output Voltage**  $(V_{IOUTdiff(Q)})^*$ . The differential output of the sensor IC when the primary current is zero. It is nominally 0 V.

**Differential Offset Voltage (V<sub>OE</sub>).** The deviation of the device output, from its ideal quiescent value of 0 V, due to nonmagnetic causes. To convert this voltage to amperes, divide by the device sensitivity, Sens.

Common Mode Output Voltage ( $V_{CMO}$ ). The average of the positive and negative zero current output voltages: ( $V_{OUTP(Q)} + V_{OUTN(Q)}$ )/2.  $V_{CMO}$  nominally equals  $V_{CC}$ /2.

Common Mode Offset Voltage ( $V_{CMOE}$ ). The deviation of the Common Mode Output Voltage from its ideal value of  $V_{CC}/2$ .

**Total Output Error (ETOT)\*.** The maximum deviation of the actual output from its ideal value, also referred to as accuracy, illustrated graphically in the Output voltage versus Sensed current chart.

ETOT is divided into four areas:

**0** A at 25°C. Accuracy at the zero current flow at 25°C, without the effects of temperature.

**0** A over  $\Delta$  temperature. Accuracy at the zero current flow including temperature effects.

**Full-scale current at 25°C.** Accuracy at the full-scale current at 25°C, without the effects of temperature.

Full-scale current over  $\Delta$  temperature. Accuracy at the fullscale current flow including temperature effects.

$$E_{TOT(IP)} = 100(\%) \; X \underbrace{ \begin{bmatrix} (V_{IOUTdiff(Ip)} - V_{IOUTdiff \; IDEAL(Ip)}) \\ Sens_{diff\_IDEAL \; X \; IP} \end{bmatrix}}_{}$$

Where

 $V_{IOUTdiff\_IDEAL(IP)} = V_{IOUTdiff\_IDEAL(Q)} + (Sens_{diff\_IDEAL} X Ip)$ 

The Total Output Error incorporates all sources of error and is a function of  $I_P$ . At relatively high currents,  $E_{TOT}$  will be mostly due to sensitivity error, and at relatively low currents,  $E_{TOT}$  will be mostly due to Offset Voltage ( $V_{OE}$ ). In fact, at  $I_P=0,\,E_{TOT}$  approaches infinity due to the offset.

This is illustrated in the total output error versus sensed current chart.

**Ratiometry.** The ratiometric feature means that the Common Mode Output Voltage,  $V_{CMO}$ , and Differential Sensitivity, Sens<sub>diff</sub>, are proportional to the supply voltage,  $V_{CC}$ . The following formula is used to derive the ratiometric change in common mode 0 A output voltage,  $\Delta V_{CMORAT}$  (%).

$$100 \left( \frac{V_{\text{CMO(VCC)}} / V_{\text{CMO(3.3V)}}}{V_{\text{CC}} / 3.3 \text{ V}} \right)$$

The ratiometric change in sensitivity,  $\Delta Sens_{RAT}$  (%), is defined as:

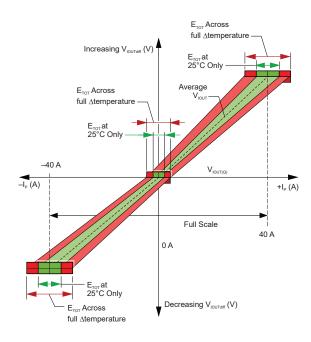

$$100 \left( \frac{\text{Sens}_{\text{diff(VCC)}}/\text{Sens}_{\text{diff(3.3V)}}}{V_{\text{CC}}/3.3 \text{ V}} \right)$$

<sup>\*</sup>Definitions of V<sub>IOUT</sub>

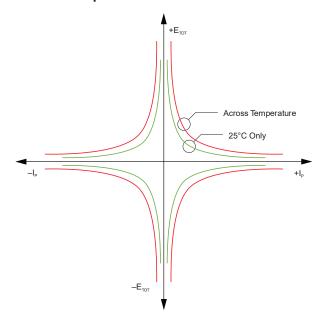

<sup>•</sup>  $V_{IOUTdiff} = V_{OUTP} - V_{OUTN}$ 

<sup>•</sup>  $V_{IOUTdiff(Q)} = V_{OUTP(Q)} - V_{OUTN(Q)}$ ; sensed current equals 0 A

#### Output Voltage versus Sensed Current Total Output Error at 0 A and at Full-Scale Current

#### **Total Output Error versus Sensed Current**

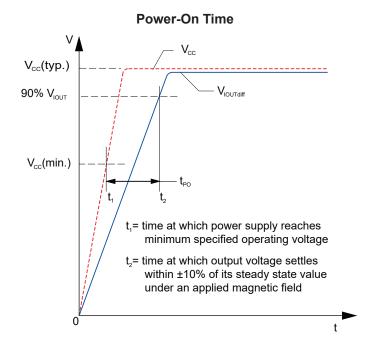

#### **Dynamic Response Characteristics**

**Power-On Time** ( $t_{PO}$ ). When the supply is ramped to its operating voltage, the device requires a finite time to power its internal components before responding to an input magnetic field. Power-On Time,  $t_{PO}$ , is defined as the time it takes for the output voltage to settle within  $\pm 10\%$  of its steady state value when full scale  $I_P$  is applied, after the power supply has reached its minimum specified operating voltage,  $V_{CC}(min)$ , as shown in the chart at right.

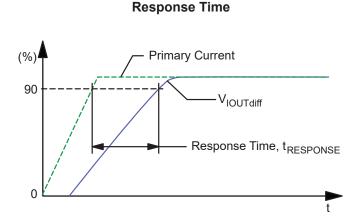

**Rise Time**  $(t_r)$  The time interval between a) when the sensor IC differential output reaches 10% of its full scale value, and b) when it reaches 90% of its full scale value.

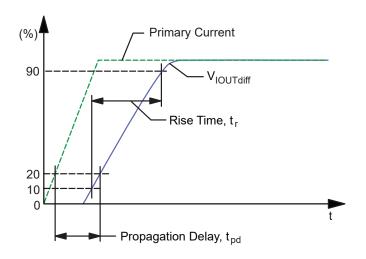

**Propagation Delay (t<sub>pd</sub>)** The time interval between a) when the input current reaches 20% of it's final value, and b) when the differential output reaches 20% of its final value.

**Response Time (t<sub>RESPONSE</sub>)** The time interval between a) when the applied current reaches 90% of its final value, and b) when the sensor differential output reaches 90% of its final value corresponding to the applied current.

Allegro MicroSystems reserves the right to make, from time to time, such departures from the detail specifications as may be required to permit improvements in the performance, reliability, or manufacturability of its products. Before placing an order, the user is cautioned to verify that the information being relied upon is current.

Allegro's products are not to be used in any devices or systems, including but not limited to life support devices or systems, in which a failure of Allegro's product can reasonably be expected to cause bodily harm.

The information included herein is believed to be accurate and reliable. However, Allegro MicroSystems assumes no responsibility for its use; nor for any infringement of patents or other rights of third parties which may result from its use.
