

## CT428-50AC Evaluation Board User Guide

### DESCRIPTION

The Allegro MicroSystems CTD428-50AC evaluation board contains the CT428—XtremeSense™ tunnel magnetoresistance (TMR) integrated circuit (IC). This user guide describes the operation and use of the evaluation board as an engineering tool for evaluating the CT428 IC performance in application.

### FEATURES

- Integrated current-carrying conductor
- Linear analog output voltage
- Response time: ~300 ns
- Low noise
- Filter function to reduce noise on output pin
- Immunity to common mode fields: -54 dB
- Overcurrent detection
- Supply voltage: 3 V to 3.6 V

## USING THE EVALUATION BOARD

### Introduction

The CT428 is a high-bandwidth and ultra-low-noise integrated contact current sensor that uses Allegro-patented XtremeSense™ TMR technology to enable high-accuracy current measurements for many consumer, enterprise, and industrial applications. The device supports eight current ranges where the integrated current-carrying conductor (CCC) handles up to 65 A of current and generates a current measurement as a linear analog output voltage. The device achieves a total output error of less than  $\pm 1\%$  full-scale (FS). The device has a 300 ns output response time when the current consumption is  $\sim 6$  mA, and it is immune to common-mode fields. The CT428 has an integrated overcurrent detection (OCD) circuit to identify out-of-range currents (OCD), and the result is output to the fault-bar (FLT) pin. The FLT is an open-drain, active-low digital signal that is activated by the CT428 to alert the microcontroller that a fault condition has occurred. The CT428 is offered in an industry-standard 8-lead small-outline integrated circuit (SOIC) package that is green and Restriction of Hazardous Substances (RoHS) compliant.

This section provides an overview of the connections and configuration options of the CT428 evaluation board. The proper configuration is highlighted and detailed in Figure 2. The CT428 datasheet contains detailed information about the use and functionality of each pin and detailed specifications about the sensor. For more detailed information, refer to the product datasheet.

Figure 2: CT428-50AC Evaluation Board

### Power Input

The two large connectors (with screws) are used to connect and drive the external current to be measured. Due to the PCB trace thermal limitation of the CT428 evaluation board, do not exceed  $50 A_{PK}$ .

### Board Configuration

A fully assembled evaluation board is illustrated in Figure 1 and Figure 2. The current to be measured is connected to the screw connectors located on the right side of the PCB. These connectors are galvanically isolated from the rest of the PCB. The CT428 can be biased by applying a 3.3 V bias voltage between the VDD and GND pins on the PCB and its output can be measured either from the VOUT SMA connector or the VOUT header pin on the PCB.

## SCHEMATIC

The schematic of the CT428-50AC evaluation board is shown in Figure 3.

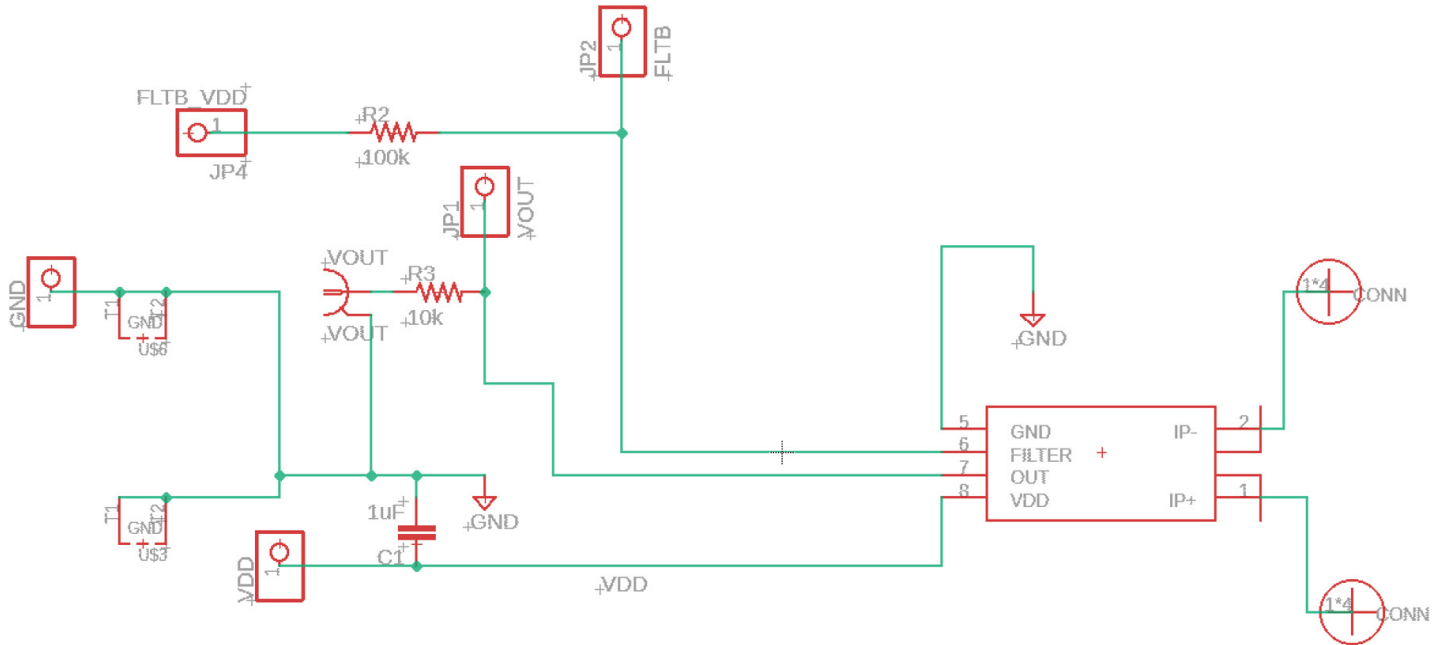

Figure 3: CT428-50AC Evaluation Board Schematic

## LAYOUT

The top and bottom layers of the CT428-50AC evaluation board are shown in Figure 4 and Figure 5, respectively.
