

## CT426-20AC Evaluation Board User Guide

### DESCRIPTION

The Allegro MicroSystems CTD426-20AC evaluation board contains the CT426—XtremeSense™ tunnel magnetoresistance (TMR) integrated circuit (IC). This user guide describes the operation and use of the evaluation board as an engineering tool for evaluating the CT426 IC performance in application.

### FEATURES

- Integrated current-carrying conductor (CCC)
- Linear analog output voltage
- Total error output  $\leq \pm 1.0\%$  FS
- 1 MHz bandwidth
- Response time: 300 ns
- Low noise: 9 to 13.5 mA rms at  $f_{BW} = 100$  kHz
- Supply voltage: 4.75 to 5.2 V
- Filter function to reduce noise on output pin
- Immunity to common mode fields:  $-54$  dB

## USING THE EVALUATION BOARD

### Introduction

The CT426 is a high-bandwidth and ultra-low-noise integrated contact current sensor that uses Allegro-patented XtremeSense™ TMR technology to enable high-accuracy current measurements for many industrial, consumer, and automotive applications. The device supports eight current ranges where the integrated current-carrying conductor (CCC) handles up to 65 A of current and generates a current measurement as a linear analog output voltage. The device achieves a total output error of less than  $\pm 1\%$  full-scale (FS). The device has a 300 ns output response time when the current consumption is  $\sim 6$  mA, and it is immune to common-mode fields. The CT426 has a filter function to reduce the noise on the output pin. The CT426 is offered in an industry-standard 8-lead small-outline integrated circuit (SOIC) package that is green and Restriction of Hazardous Substances (RoHS) compliant.

This section provides an overview of the connections and configuration options of the CT426 evaluation board. The proper configuration is highlighted and detailed in Figure 2. The CT426 datasheet contains detailed information about the use and functionality of each pin and detailed specifications about the sensor. For more detailed information, refer to the product datasheet.

Figure 2: CT426-20AC Evaluation Board

### Power Input

The two large connectors (with screws) are used to connect and drive the external current to be measured. Due to the PCB trace thermal limitation of the CT426 evaluation board, do not exceed 20 A<sub>PK</sub>.

## Board Configuration

A fully assembled evaluation board is illustrated in Figure 1 and Figure 2. The current to be measured is connected to the screw connectors located on the right side of the PCB. These connectors are galvanically isolated from the rest of the PCB. The CT426 can be biased by applying a 5 V bias voltage between the VDD and GND pins on the PCB and its output can be measured either from the VOUT SMA connector or the VOUT header pin on the PCB. In addition, if C2 is populated with a 100 pF capacitor, the FILTER SMA connector provides a filtered output of the CT426 with a 3 dB cutoff frequency of approximately 100 kHz; otherwise, the 3 dB cutoff frequency is 1 MHz. Refer to Figure 3.

Figure 3:  $C_{\text{FILTER}}$  (pF) vs. 3 dB Cutoff Frequency (kHz)

## SCHEMATIC

The schematic of the CT426-20AC evaluation board is shown in Figure 4.
